# **Economic Value of Nature**

Of what economic value is nature

one of the main flaws of a market based economy is that the prices and cost estimates rarely reflect the full costs of environmental damage and losses to sustainable uses

#### difference between direct costs and externalities

In past natural areas and biodiversity were given no commercial value

→ only the potential profits were part of the equation

tended to favor nonsustainable uses: fisheries  $\rightarrow$  overfishing mining  $\rightarrow$  damage to land and waters timber  $\rightarrow$  loss of forests agriculture  $\rightarrow$  loss of praries and soil low raw land values  $\rightarrow$  little value unless developed

and increased pollution eg. salinization eg. siltation

need to develop ways to estimate some of these external costs: the value of lost productivity costs of cleanup of a damaged ecosystem increases in disease, homelessness, etc

Human Ecology: Economic Value of Nature, Ziser, 2004

#### V. Social Values and Human Costs of Nonsustainable Uses

VI. Aesthetic, Cultural, Moral and Ethical Values

Can make a strong argument that economics are one of the strongest reasons to preserve nature:

# I. Direct Economic Values

- A. Timber
- B. Nontimber raw materials
- C. Industrial Chemicals & Products
- D. Medicines and Pharmaceuticals

## **II.** Future economic Potential

- A. Future Commercial Products
- B. Gene Banks for agruculture and livestock

# III. Tourism

## **IV. Nature's Services**

- A. Habitat and refuge for diversity & nursery areas for commercially important species
- B. Water Supply and Flood Control
- C. Waste & Nutrient recycling, water purification & Pollution Control
- D. Early Warning System
- E. Climate Regulation
- F. Pollination and Agriculture
- G. Biological Pest Control

# I. Direct Economic Values

# A. Timber

lumber, plywood, veneer, particleboard

exceeds use of steel and plastic combined

international trade in timber, pulp and paper = \$114 B/yr

90% of legal and recorded trade is from temperate and boreal forests

 $\rightarrow$  soon half of this will be for paper alone

most of paper produced worldwide is made from virgin logs

only  $\sim 1/3^{rd}$  comes from recycled wastepaper

developing countries produce most wood but use only ~20% themselves

timber, paper and pulp comprises ~ half of consumption ~1.66 B tons/yr

1

2

total world wood consumption ~ 3.7 B tonnes/yr (3.7 B m<sup>3</sup>/yr)

- timber could be harvested sustainably but today only  ${\sim}0.1\%$  is logged this way
- ~ half of wood cut worldwide is used for fuelwood and charcoal
  - → mostly in developing countries
- Amazon will be world's top timber source in coming decades
- Africa will be second
  - → European companies have tended to dominate here
- Asian Companies have bought 8.6 M acres in Brazil (96 AAS)
  - in next 2 years will be 22.2 M or 15% of harvestable forest

most amazon loggers favor this

- → they are competing to sell land and sawmills to Asians
- regional demand for lumber has sagged and Asians represent money and jobs
- July 96: Brazil's president, Cardoso, decreed

Human Ecology: Economic Value of Nature, Ziser, 2004

beargrass, huckleberries, solal and sword fern

= \$72 Mil/yr

in some areas value of nontimber products may exceed timber value of same area

- 1989 study (Peters, Gentry, Mendelsohn, Nature June 29,1989) estimate:
  - that the net value of sustainable collection and sale of fruits, oils, rubber, and medicines from Amazonian rain forest would generate over \$6330/ha/yr
  - vs cutting a rain forest for timber yields \$1000/ha for one time use or \$490/ha/yr from selective cutting
  - or tree plantation on a hectare of cleared forest is worth \$3184/yr
  - or pastureland on one ha of cleared forst is worth \$2960/yr

2 yr suspension for new logging concessions for mahogany and other rare hardwoods

he also said current concessions will be revoked for any companies not practicing sustainable logging

#### Firewood

- >1/2 people in world depend on firewood or charcoal as main source of heating and cooking fuel
- ~1.5 B people can no longer find enough ave =  $\sim 1m^3/person/yr$

### **B. Nontimber raw materials**

eg. food, fiber, fuels, fertilizers, art objects, etc

providing these services requires healthy ecosystems

eg rattan trade (Asia)

\$2.7 Bil/yr

in Thailand value of Rattan exports is 80% of legal timber exports

eg. market for 4 "obscure" plants in Oregon forests

Human Ecology: Economic Value of Nature, Ziser, 2004

# **C. Industrial Chemicals & Products**

- many important compounds come from or were 1<sup>st</sup> discovered in wild organisms
  - eg. rubber tree, antibiotics, aspirin, dyes, foods and spices, paper & clothing, etc

if forests and their inhabitants are used sustainabily it could be a continuing source of these and as yet unknown commercial products

5

6

# **D. Medicines and Pharmaceuticals**

US → 25% of all prescriptions and 60% of non prescription drugs contained active cmpds extraced from natural products (1996)

- global pharmaceutical industry = 200B/yr  $\rightarrow$  global forest derived drugs ~40-100 B/yr
  - eg. digitalis → heart quinine → malaria antibiotics → fungi aspirin → pain relief taxol → anticancer
- of 76 pharmaceutical products derived from plants only 6 can be artificially synthesized at commercial levels
- in some cases, collecting medicinal plants provides significant income to indigenous peoples
  - eg. Belize- gathering medicinal plants yields 2-10 x's the annual income of slash/burn farmers
- not just plants, all kinds of organisms

eg. microorganisms (bacteria and fungi) → produce over 3000 antibiotics

eg. snakes → antivenoms, anticoagulants amphibians → neurochemicals corals → antiviral cmpds sponges → antitumor cmpds seaslugs → painkillers

Human Ecology: Economic Value of Nature, Ziser, 2004

that have already become extinct = \$12 B in US alone

the more rare species that grow under unusual conditions are often the ones most important and most likely to be destroyed

#### 11

9

# II. Future economic Potential

# A. Future Commercial Products

- only ~1% of rainforest species have been examined for their potential uses
- only ~5% of all plant species worldwide have been screened for pharmacological substances
  - eg. of 275 species found in 1 ha of rainforest → 72 species yielded products that could be exploited for direct economic gain
  - eg. of 842 individual trees → 350 yielded products with direct economic value

these investigations are long and extremely expensive:

- eg. from 1960-1981 American Institute for Cancer Research investigated  $\sim$  30,000 different plants that contained  $\sim$  114,000 potential anticancer agents
  - $\rightarrow$  only 5 substances were selected for clinical trials
  - $\rightarrow$  only 1, taxol was approved for medical use

"potential" commercial products were not recognized as valuable until recently

eg. rubber tree's uses were completely unknown 150 yrs ago

est loss of potential pharmacological value from plants Human Ecology: Economic Value of Nature, Ziser, 2004 10

# B. Gene banks for agruculture and livestock foundation for all agricultural plants and animals all modern crop varieties were originally produced using native plants traits were selected over 100's or 1000's of years most crops in US are domesticated species from tropics 1. inbred species require gene infusions maintaining wild varieties of crop plants allows us to select for new traits or revitalize aging genetic stock 2. may want to look for new genes in same species that might be useful eg. 1.5 M acres of California farmland is threatened by salinization $\rightarrow$ trying to find salt tolerant strains of plants that can grow there eg. 1970 So Corn leaf blight $1^{st}$ in Fla $\rightarrow$ wiped out \$1 B corn all US corn was based on 6 inbred lines now have a resistant strain to this disease 3. also, many countries have "Germ Plasm Repositories" for domestic crops. Human Ecology: Economic Value of Nature, Ziser, 2004

but some seeds, esp larger seeds, lose viability	III. Tourism
after a few years.	mainly "ecotourism"
seeds are planted and new seeds are collected	observations and appreciation of wildlife and natural areas
may need to collect new wild seeds to augment diminishing seed stores	tourism has become the largest sector of world
est value of "gene banks" (crop ancestors) =\$66 B	
+	-> transforms wilderness into prosperity
	US protects ~ 3% of all US land; >76M acres in alaska alone
	→roads, timbering, motor vehicles etc are all prohibited
	these areas are strictly controlled and are open to hiking, camping, canoeing
	Parks
	$\rightarrow$ more intensive use; less fragile areas
	US Natl Park Service was established >100 yrs
	with estab of yellowstone
	established "to preserve natural areas of public lands considered unique because of scenergy, history, wildlife, etc"
Human Ecology: Economic Value of Nature, Ziser, 2004 13	Human Ecology: Economic Value of Nature, Ziser, 2004 14
<pre>parks preserve another 76M acres in US &gt;100 countries have adopted our system of parks as a model parks are intensively used unfortunately while visitation has increased, maintenance budgets have been reduced</pre>	<ul> <li>     \$\$\$25,000 to kill a rhino     ave profit for raising wildlife produced = 8%     very strict quotas     not saving the individual, trying to save the species         <ul> <li>&gt; sustainable use</li> </ul> </li> <li>but animal rights folks go nuts</li> </ul>
→ costs tourists/hunters \$15,000 to kill a leopard Human Ecology: Economic Value of Nature.Ziser.2004 15	Human Ecology: Economic Value of Nature, Ziser, 2004 16

IV. Nature's Services:	→70% of US commercial fish species use coastal wetlands as part of spawning and
A. Habitat and refuge for diversity &	nursery areas
commercially important species	$\rightarrow$ 95% of fisheries in Gulf of Mexico
a fundamental service provided by nature is ensuring that ecosystems are relatively <b>stable</b> and	in 1991, US fish valued at \$3.3 B were caught
= the ability to withstand disturbance and bounce back	fish processing and sales industry generates 10 x's that amount
as ecosystems are affected by human activities they become simplified	yet >40% of these areas in US have been damaged or destroyed
and become more brittle and more vulnerable to decline	wetlands have been converted to intensive
some species act as "keystone species" → their destruction would likely permanently alter the ecosystem in which they are found	aquaculture in several countries: eg. Phillipines: 78% of coastal wetlands
estuaries are thin fragile zone along coastlines where	eg. Ecuador 70% of coastal wetlands $\rightarrow$ can bring \$11,600/ha/yr for ~ 5-10 yrs
ocean waters	using natural mangroves for fish, game, fuel,
these areas offer food and shelter for wading birds and water fowl	wood, medicines etc could bring \$1000- 10,000/yr indefinitely
coastal and inland wetlands also support commercial fisheries:	
Human Ecology: Economic Value of Nature, Ziser, 2004 17	Human Ecology: Economic Value of Nature, Ziser, 2004 18
B. water supply and flood control	C. Waste recycling, water purification, & pollution control
eg. if $\sim 1/2$ of Mississippi Basins lost wetlands were restored in strategic locations (3% of land total needed)	plants, bacteria, fungi can remove toxins from air, water and soil:
→ could control flood of 1993 magnitude that caused \$12-16 B damage	eg. CO2 and SO2 are removed by vegetation eg. CO is removed by soil microorganisms eg. Nox is removed by fungi and bacteria
	eg would cost \$100,000/yr to duplicate water purification and fish propagation value of 1 acre of wetland
	worms, insects and microorganisms create and aerate soil and recycle nutrients
	current agricultural and forestry practices destroy soil
	erosion protection ~ \$200/ha
	water purification and storage is a major part of the water cycle
	estimates for value of water recharge and storage services near large cities = \$40,000/ha
	for each 1% increase in wetlands, downstream flooding decreases 3% -4%
Human Ecology: Economic Value of Nature, Ziser, 2004 19	total losses due to unsustainable wetland and soil Human Ecology: Economic Value of Nature, Ziser, 2004 20

practices: US = \$44 B/yr World = \$400 B/yr	D. early warning system some organisms are good indicators of degradation e.g. Bald Eagle e.g. Peregrine Falcon e.g. lichens e.g. stream insects
Human Ecology: Economic Value of Nature, Ziser, 2004 21	Human Ecology: Economic Value of Nature, Ziser, 2004 22
<ul> <li>E. climate regulation</li> <li>destruction of forests → decomposition and burning releases CO2 into the air</li> <li>eg. 1 ha of "carbon storage" function of forests ~ \$3000 value</li> </ul>	<ul> <li>F. pollination and agriculture</li> <li>w/o plants cannot produce seeds</li> <li>&gt;90% of worlds flowering plants are animal pollinated</li> <li>and 80% of worlds 1330 cultivated crop species are animal pollinated</li> <li>1/3<sup>rd</sup> of US agricultural crops is insect pollinated</li> <li>eg pollination US valued at \$6.7 B/yr(2006)</li> <li>120,000-200,000 animal species are known pollinators</li> <li>also, &gt;1000 species of birds and mammals</li> <li>honeybee pollination services are 60-100 x's more valuable than the honey they produce</li> <li>in US &gt;1/2 honeybee colonies have been lost in the last 50 yrs (25% in last 5 yrs alone)</li> <li>threates:</li> <li>habitat fragmentation</li> <li>loss of nesting and overwintering sites</li> <li>intense wxposure to pesticides and herbicides bioinvasions (eg Killer bees)</li> </ul>
Human Ecology: Economic Value of Nature, Ziser, 2004 23	Human Ecology: Economic Value of Nature, Ziser, 2004 24

#### G. biological pest control V. Social Values and Human Costs of Nonsustainable Uses pesticides used in agriculture kill both pests and beneficial animals as well eq. as rainforests are cleared the indigenous peoples $\rightarrow$ becomes a vicious cycle of needing more usually suffer and more pesticides greater chances of droughts or floods loss of these beneficial insects has led to a rise in new agricultural pests vector-borne diseases loss of topsoil sedimentation of streams and rivers many wild populations are beneficial in less direct diminished yields from their crops ways: fewer fish in streams shrinkng supplies of game, fruits, nuts eg. Bat colonies in Texas can eat 250 tons of insects each night rising: alcoholism drug abuse eq. Bangladesh domestic violence exported frog legs in 70's and 80's homelessness led to steep decline in frog population emigration increase in outbreaks of pests and disease 25% increase in pesticide imports by 1989, Bangladesh was spending 3 x's as much each year on pesticides (430M) as it was earning from exporting frog legs within 1 yr of banning exports frog population increased dramatically pesticide imports dropped 30-40% 25 26 Human Ecology: Economic Value of Nature, Ziser, 2004 Human Ecology: Economic Value of Nature, Ziser, 2004 VI. Aesthetic, Cultural, Moral and eg. landscape beauty: birds, flowers, wildlife, etc **Ethical Values** some animals and plants have cultural significance eliminating a few species won't cause ecosystem collapse others we may never "see" in nature, but its nice to know they are there probably won't irreversibly affect human progress eg narwhales, rainforests, etc but "Human intelligence is bound to the presence Do we have the right to "play god" of animals...they further, throughout our lives a refining not only with individual lives and maturing knowledge of personal and human being' -Paul Shepard but with whole species and ecosystems 'Thinking Animals' we don't have "divine permission" to kill them Do species have a moral right to exist independently of our need for them → we must be global stewards "If I decide to accept your offer to buy our land, I will make one condition. The white man must treat the beasts of this land as his brothers. I am a savage and do not understand any other way. I have seen a thousand rotting buffaloes on the praries left by the white man who shot them from a passing train. What is man without the beasts? If all the passing train. What is man without the beastsr at an the beasts were gone, men would die from great loneliness of spirit, for whatever happens to the beasts also happens to the man. All things are connected. Whatever befalls the earth, befalls the sons of the earth." - Chief Seattle also biological diversity adds to our quality of life 27 Human Ecology: Economic Value of Nature, Ziser, 2004 28
