# The Lymphatic System

network of tissues, organs and vessels that help to maintain the body's fluid balance & protect it from pathogens

like the circulatory system, the lymphatic system consists of "pumps", a series of vessels, and a fluid called lymph

unlike the circulatory system it is a 1-way system

→ lymph doesn't "circulate" around in a loop like blood

→lymph is collected from the tissues and delivered to the

lymphatic system is directly connected to the circulatory system

it helps the circulatory system to do its job

without it neither the circulatory system nor the immune system would function

can be thought of as an accessory to the circulatory system

Human Anatomy and Physiology: The Lymphatic System; Ziser Lecture Notes, 2014.3

some WBC's (lymphocytes, monocytes) are made in lymphatic tissues (not bone marrow)

including body's main supply of lymphocytes

# 5. Body Defense/Immunity

lymphoid tissue is an important component of the Immune System (forms a diffuse surveillance defense system in all body tissues and organs

the major role of WBC's is in body defense

lymphatic system screens body fluids and removes pathogens and damaged cells

#### Lymph

lymphatic system contains a fluid derived from plasma =lymph

Lymph is a clear watery fluid that resembles blood plasma but:

has fewer proteins

its composition varies depending on organs that it drains

the lymphatic system handles 125 ml/hr (2.5-2.8 liters /day)

 $\sim 1/2$  of this from the liver and small intestine alone

# lymph contains white blood cells

(esp lymphocytes and macrophages(monocytes))

# Lymphatic Vessels

nan Anatomy and Physiology: The Lymphatic System; Ziser Lecture Notes, 2014.3

#### **General Functions of Lymphatic System:**

#### 1. Returns Fluid from Tissues to Blood

~85% of fluids that leak out of blood returns to blood via blood capillaries

~15% returns via lymph capillaries

in 24 hrs lymphatics return fluid equivalent to entire blood

if lymphatic system becomes blocked → edema

## 2. Returns Large Molecules to Blood

~25-50% of blood proteins leak out of capillaries each day

they cannot get back into capillaries

instead lymphatic capillaries pick them up and return them to the blood

if lymphatics are blocked blood protein decreases leading to fluid imbalances in body

# 3. Absorb and Transport Fats

Special lymphatic capillaries (=lacteals) in villi of small intestine absorb all lipids and fat soluble vitamins from digested food

bypasses liver

much goes straight to adipose tissues

#### 4. Hemopoiesis

Human Anatomy and Physiology: The Lymphatic System; Ziser Lecture Notes, 2014.3

2

# a. Lymphatic Capillaries

originate in tissues as tiny blind ended

lie side by side with blood capillaries

single layer of endothelial cells like blood capillaries

but much more permeable to solvents, and large solutes and whole cells

#### b. Lymphatic Vessels

these small lymphatic capillaries merge with others to form larger lymphatic vessels

lymphatic vessels resemble veins in structure:

a. three layers - but much thinner

b. 1-way valves - but many more (every few mm or so)

c. also has lymph nodes at intervals along its course

#### Lymph Nodes

scatterted along the lymphatic vessels are lymph nodes, also called lymph glands

4

oval, vary in size from pinhead to lima bean most numerous of the lymphatic organs (100's)

#### **Functions of Lymph Nodes:**

cleanse lymph: remove dead cells and microorganisms

alert immune system to pathogens

formation of white blood cells

lymph moves into nodes by way of several **afferent**lymphatic vessels

moves through sinus channels lined with phagocytic cells (reticuloendothelial cells or macrophages)

exits via 1-3 efferent lymph vessels

fewer efferent vessels creates a bottleneck and slows flow as lymph is "screened"

the macrophages and reticular cells in each node remove ~99% of impurities

-> as lymph passes from node to node virtually all impurities are normally removed

Human Anatomy and Physiology : The Lymphatic System; Ziser Lecture Notes, 2014.3

5

lymph nodes are widespread in body but most occur in groups or clusters:

# eg. submental & submaxillary lymph nodes

floor of mouth; drain nose, lips teeth

## eg. cervical lymph nodes

neck

drain neck and head

#### eg. axillary lymph nodes

armpit (axilla) and upper chest drains arm and upper thorax including breasts

#### eg. inguinal lymph nodes

in groin area drain legs and genitals

as lymphatic vessels converge they become larger and larger

# c. Lymphatic Ducts

these lymphatic trunks merge together to form two major **Lymphatic Ducts** 

equivalent to major vessels of circulatory system but more like veins than arteries

Human Anatomy and Physiology: The Lymphatic System; Ziser Lecture Notes, 2014.3

6

Two major Lymphatic Ducts:

# **Right Lymphatic Duct**

very short drains upper right quadrant of body drains into right subclavian vein at jct with jugular V

# **Thoracic Duct**

much larger and longer drains the rest of body (3/4ths): all of body below diaphragm and left arm and left side of head, neck and thorax begins just below the diaphragm, anterior to vertebral column lumbar trunks and intestinal trunk join to form saclike **cysterna chyli** drains into left subclavian vein

# Lymphatic Pumps:

fluid pressure in lymphatic system is very low, as in veins

vessels contract rhythmically

->direction of flow is maintained by 1-way
valves

also body movements and pulsing of arteries help to move lymph along

ightarrow many vessels are wrapped in connective

tissue with arteries: the pulsing of the arteries also helps move lymph along

as lymph drains into subclavian veins the rapid flow of blood also draws lymph in

# **Major Accessory Lymphatic Organs**

## 1. Tonsils

masses of lymphoidal tissue ebedded in mucous membranes of pharynx

covered by epithelium, with deep pits(=crypts)

crypts often contain food debris, bacteria, dead wbc's etc

three main sets of tonsils:

#### pharyngeal tonsils (=adenoids)

on wall of pharynx behind nasal cavity

# palatine tonsils

at post margin of oral cavity

largest and most often infected = tonsilitis usually *Streptococcus* today usually treated with antibiotics

#### lingual tonsils

Human Anatomy and Physiology : The Lymphatic System; Ziser Lecture Notes, 2014.3

on each side of root of tongue

#### 2. Spleen

largest of the lymphatic organs

located below diaphragm in left hypochondriac region

spleen performs several functions:

1. defense

helps screen blood and removes pathogens and bacteria

2. hemopoiesis

monocytes and lymphocytes are made here

(before birth, RBC's also made here)

3. erythrocyte and platelet destruction

spleen is "erythrocyte graveyard" iron is salvaged from RBC's

4. blood reservoir

able to store blood (~350ml)

can constrict and pump blood into circulatory system if hemorrhaging

= self transfusion (can squirt 200 ml into blood in <1minute)</pre>

 $Human\ Anatomy\ and\ Physiology: The\ Lymphatic\ System;\ Ziser\ Lecture\ Notes,\ 2014.3$ 

also, helps stabilize blood volume by transferring excess plasma from blood to lymphatic system

# 3. Thymus

is single unpaired organ in mediastinum and neck region

plays vital role in initial set up of body's immune system

- → source of lymphocytes before birth which circulate to spleen, nodes and vessels
- → soon after birth it secretes a hormone that causes lymphocytes to develop into plasma cells

once this job is done it degenerates

seems to complete its essential job by end of childhood

largest when young, esp puberty

then gets smaller and is replaced with fat

#### 4. Lacteals

specialized lymphatic capillaries in the villi of the intestine

used to absorb fats and oils after digestion

Human Anatomy and Physiology : The Lymphatic System; Ziser Lecture Notes, 2014.3

10

# **Diseases of Lymphatic System**

# <u>Edema</u>

any disruption of lymphatic flow can lead to edema

→ excessive accumulation of interstitial fluid

results from injury, inflammation, surgery, or parasitic infections

### **Metastatic Cancers**

metastasis is when cancer cells break free of original tumor and travel to other sites in the body

lymph nodes are common sites of metastatic cancer

since lymphatic capillaries are so permeable, cancer cells can easily enter and travel in the lymph

tend to lodge in  $1^{st}$  node they enter and enlarge and destroy the node = lymphoma

once lymphoma is established cells travel from their to other nodes

# **Hodgkin Disease**

lymph node malignancy

early symptoms: elarged, painful nodes, esp in neck; fever, anorexia, weight loss, night sweats, severe itching

11

often progresses to neighboring lymph nodes

# Non-Hodgkin Lymphoma

lymphoma similar to above but more comon

more widespread distribution in body with higher mortality rate

#### **Ruptured Spleen**

one of most common consequences of blows to left thoracic or abdominal wall

it bleeds profusely if damaged, may cause fatal hemorrhaging

removal of spleen usually not serious since functions are shared with liver and bone marrow
